

# Synopta®

- Many options for presenting and analyzing data
- Easily create own summaries and settings screens
- Synopta offers maximum reliability and ease of use.

## Synopta® Still Setting the Tone

For years now, Synopta® has been the leading operating and information software used on the HortiMaX process computers. Synopta's success is partly thanks to its user-friendly interface, enabling the user to easily navigate through the various settings and readouts. Synopta® also includes a range of options for presenting and analyzing data. You can create your own summaries and settings screens, or a combination of both, and fully customize them to your needs. You can customize anything from the colours, fonts and backgrounds to your favourites list and toolbars.

growing solutions

# Synopta®

*Synopta® was recently expanded with new features, such as the Task Planner. This enables you to automatically export data from Synopta® for use in other programs, such as Excel. Another addition is the logbook which registers the name and time of settings that are changed and who changed them. The logbook also saves any messages and alarms generated by the computer. Also new is the linking screen which makes it easy to link large numbers of valves to valve groups or irrigation programs. You simply drag and drop valves into other groups using the mouse. This can be done either valve by valve or for a number of valves at once.*

A unique feature in Synopta® is that every summary, settings screen, setpoint graph, historical graph or statistical table is shown in its own window. It is possible to open any number of these windows at the same time. After opening a number of related windows, you can save them as a group and retrieve them later with a click of the mouse. This allows you to create groups of related windows for Heating, Energy, Irrigation, etc. In short, Synopta® offers you maximum reliability and ease of use.

## **MultiMonitor**

A modern horticultural business needs to deal with an increasing amount of process data. The amount of data needed to make the right decisions can be so extensive that it simply won't fit on one screen. Synopta® solves this problem with the MultiMonitor, which transforms two or three screens into one large one. As a result, you can double or triple the amount of data that can normally be displayed. And the more data you are shown using this "Synopta cockpit", the more options you have!

## **Pocket Synopta®**

There is also a pocket version of Synopta® which runs on a pocket PC and enables you to operate your process computer remotely. You can view alarm messages, summaries and graphs, and adjust any settings with a device small enough to fit inside your pocket. Using various wireless communication media, such as GSM, WiFi and GPRS, you can quickly access your climate, energy or fertigation management programs from any location. You can even operate several greenhouse sites using this single program.

Pocket Synopta's interface and operating structure exactly matches the PC version of Synopta®, so you won't have any trouble getting started!
