

P-Plus®

- Clear symbols on input terminal
- Input also possible using code keys
- Input menu displayed in the language of the worker
- Registrations through mobile PDA
- Current overview of labour performance and harvest yields
- Instant feedback to workers about performance
- Quick and simple correction of incorrect input
- Clear insight into labour costs
- “Linkable” to weighing and sorting units
- Access control for maximum safety

Tailor made management of your crop production

The following aspects are vital in labour and production registration systems: increasing product and labour quality, avoiding bottlenecks and tracing and minimizing avoidable costs. The P-Plus® registration system from HortiMaX incorporates all these objectives. P-Plus® offers you unparalleled options to tailor the management of your company to your exact wishes and requirements. This will give you direct control over yields and labour costs and enable you to guide the quality of labour and production.

P-Plus®

New module: P-Plus® “Access control”

This module allows you to program which workers may enter the greenhouse through which doors and at what times. This safeguards the access to your site. All outer entrance gates and doors can be fitted with access control systems. If necessary, offices and private rooms can also be secured. Workers identify themselves at the door with their personal code key.

P-Plus® then compares the code key with the access rights that you have assigned to that worker. If the worker's access rights allow him to enter the building, the door opener will send a signal to the electronic door lock and the lock will open. P-Plus® then registers who entered through which door and at what time. P-Plus®, however, also registers which workers were denied access and when. Workers are easily linked to specific access doors and times. The access times are also easily adjusted, should one or more workers need additional access time during a certain period. The access rights set for each door are shown in a clear overview. P-Plus® “Access control” will maximize your company security!

Real-time information

One of the main benefits of P-Plus® is that it instantly feeds back information. The data entered by the workers in the greenhouse are instantly processed by the central system into the data you need. This enables you to keep constant track of the yields and the progress of production. It also allows you to check if the quality of the work is up to standard, if you will make your deadlines (or more labour is required) and if you can deliver tomorrow or perhaps even today. This is all vital information because it helps you manage daily production, streamline company processes and control costs.

Motivates workers

P-Plus® provides instant feedback to the workers on their work performance. This motivates workers because they are shown their performance results straight after registering a task. Workers can check their own performance or view those of other workers or worker group on the terminal server in the canteen. This encourages workers to compare their performance results.

Effective management

P-Plus® excels in terms of user-friendliness. The program converts your analyses into clear and well-organized charts, tables and greenhouse plans (“Greenhouse Overview”), giving you instant access to what is happening in your greenhouse. P-Plus® is designed to prevent incorrect data input as much as possible. The system will automatically recognize incorrect input and offer an alternative. The use of code keys has made the incorrect input of worker-specific data a thing of the past.

P-Plus® has another unique feature, however: It operates as a bi-directional system. This means that data is not only sent from the greenhouse to the central system, but P-Plus® also allows you to send information back to the terminals (and therefore the workers) in the greenhouse. This means that you can review data on workers, rows, carts or tasks from any terminal in the greenhouse, making your operational management truly effective!

Modules and links

The P-Plus® software is divided into modules. A number of these modules can be linked to external software programs. The “Production” module can be linked to weighing and sorting units, for instance. HortiMaX supplies various weighing systems to register production. Hoist weighing units, mobile weighing bridges and fixed weighing units with cart recognition systems can all be integrated into P-Plus®. Recent improvements have meant P-Plus® can also register work performances from the packing rooms. The “Observations” module includes a link to Crop-IT®. Crop-IT® is the management program used for integrated crop protection, quality assurance and environmental registrations. Using the “Reports” module, you can even export data to MS Excel.
